WORLD CONGRESS OF EPIDEMIOLOGY 2024

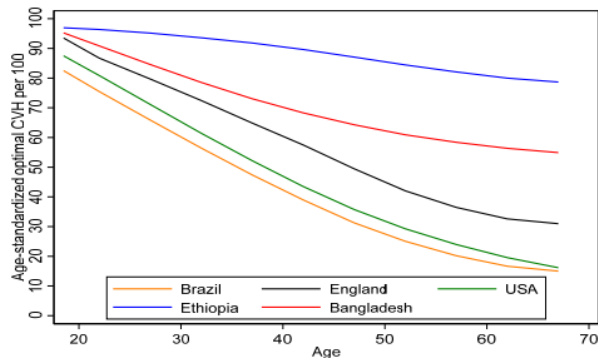

Cardiovascular Health vs Disease

- Cardiovascular Disease (CVD) morbidity and mortality increasing in LMICs
- Outpacing many detection and treatment efforts
- Cardiovascular health (CVH) in contrast typically declines with age and other CVD risk factors
- Ideal CVH is common in childhood
- Should greater public health emphasis be placed on CVH preservation (primordial prevention)?

Measuring CVH across the lifecycle

Figure 3: Age-specific high CVH rates for the five countries (adults aged 18-69y)

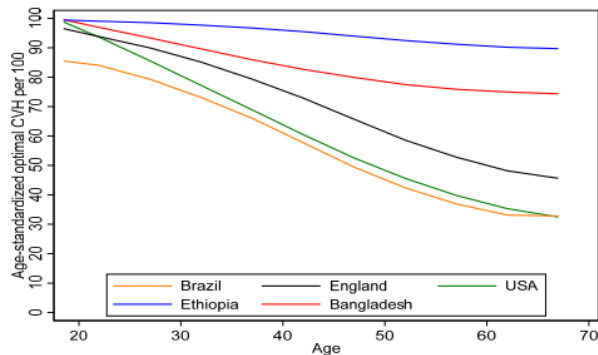

CVH Scores available (LS7, LE8)

- BP, BMI, glucose, cholesterol, physical activity, tobacco use, sleep, diet

Applied to population survey data from five countries

3a. Based on six metrics (blood pressure, BMI, cholesterol, glycemia, smoking, physical activity)

Increased country income level

Decreased prevalence of high CVH

- Excess body weight driving poor CVH in HICs
- Current smoking higher in LMIC (Bangladesh)

3b. Based on five metrics (as 3a. but excluding physical activity)

Ware et al. Can J Cardiol Open. 2024

CVH decline starts in childhood

- 5 prospective cardiovascular cohort studies from the US & Finland (1973 to 2015; n=9388)

Does childhood CVH differ by country?

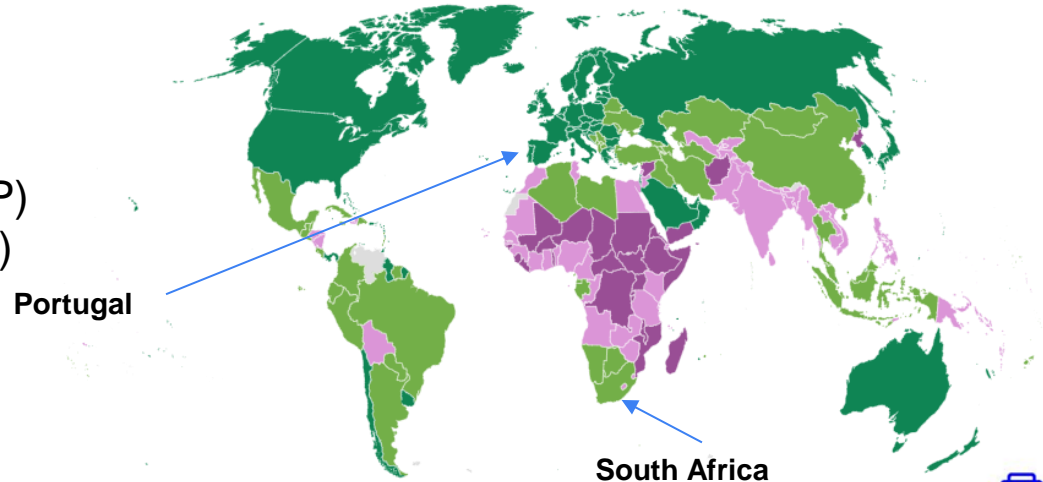

AIM:

- To evaluate childhood CVH in **Generation XXI** - Portugal (n=8647; age 4-10y)
- And compare with a small LMIC cohort (**Birth to Twenty** - South Africa, n=78; age 4-10y)

■ High Income ■ Upper-middle Income ■ Lower-middle Income ■ Low Income ■ Not Classified

CVH indicators evaluated:

- Body mass index (BMI);
- Diastolic blood pressure (DBP)
- Systolic blood pressure (SBP)

World Bank Group country classification by income level

SBP
7 years

10 years

- SA children:
- Lower BMI
 - Higher BPs

Plot of means difference in BMI, DBP, and SBP among countries based on children's age.

Results

4 years

7 years

10 years

Three distinct groups of children:

PC1 - high BMI, SBP & DBP

PC2 – high BMI & SBP, but lower DBP

PC3 – lower BMI, SBP & DBP

SA children predominantly PC1

PC1 membership in Portuguese children predicted by parental SES

Conclusions

- Socioeconomic disadvantage appears to set children on a path toward poor cardiovascular outcomes from a young age.
- Lends support to earlier vascular aging in South African children.
- Targeted strategies are critical to maintain **CVH** from childhood.
- Strengthen early childhood interventions to address **CVH** disparities.

Further data and analysis needed

Severe limitations with recent SA data availability: need larger datasets and follow-up
